# Catalog of Plant Germplasm Available From the Subtropical Horticulture Research Unit, Miami, Florida

Compiled by P. K. Soderholm, *horticulturist*  
*Agricultural Research Service*

The compiler thanks Agricultural Research Service employees Irene Galvin for assistance in recording plant information, Arthur Tipps for computer assistance, and Robert J. Knight, Jr., for proofreading, and Norma Little, of the Dade County (Florida) Council of Garden Club Presidents, for proofreading.

This publication is available from the Subtropical Horticulture Research Unit, 13601 Old Cutler Rd., Miami, Fla. 33158.

On June 17, 1981, the Secretary of Agriculture abolished the Science and Education Administration, formerly the publisher of this series, and re-established the four agencies (Agricultural Research Service, Cooperative State Research Service, Extension Service, and National Agricultural Library) out of which SEA had been organized in 1978. This series will continue under the imprint of the Agricultural Research Service (Southern Region).

Catalog of plants .....	1
Plant families represented in the collection .....	90

## ABSTRACT

The catalog lists 5,400 accessions of tropical and subtropical plants representative of 149 families. Included are mango, avocado, *Ficus*, palm, coffee, cocoa, *Dioscorea*, *Cassia*, rubber, *Sansevieria*, and many other species of ornamentals and fruits. Seed, fruit, and other plant parts are available to researchers and to nurserymen, farmers, and other commercial interests for "starts" if no commercial sources of supply exist. Index terms: catalogs, germplasm, plants, Subtropical Horticulture Research Unit, subtropical plants, tropical plants.

## INTRODUCTION

The Subtropical Horticulture Research Unit, a facility of the Agricultural Research Service, U.S. Department of Agriculture, is located south of Miami on a 200-acre site well situated for growing most subtropical and tropical plants. Summer and winter, temperatures are moderated by sea breezes off nearby Biscayne Bay. Rainfall, about 1,650 mm (65 inches) per year, occurs mainly in March and from May through early November.

Since the original station opened in 1898, the facility has been a gene bank from which scientists, educators, farmers, plant breeders, and nursery operators have drawn plant material for use in their research and production programs. This catalog lists the plants in the living collection. Provided a plant has reached sufficient maturity and depending upon availability, seed, fruit, and other plant parts will be provided on request for research or to provide nurserymen, farmers, and other commercial

interests a "start" for stock if no commercial sources of supply exist. We prefer to provide material in exchange for material we need, although this is not a criterion for receiving germplasm. **Germplasm is not available to individuals for gardening, landscaping, and similar purposes.**

The collection records maintained for most plants are also available on request to users of the germplasm. These records contain information on collection site (country, locality, altitude, soil type, rainfall, etc.), production, use, and disease and insect resistance.

The collection contains 5,400 accessions of tropical and subtropical plants representative of 149 families. Major emphasis is on fruit crops, especially mango and avocado; ornamental crops, especially *Ficus* and palm; and beverage crops (coffee and cocoa). There are smaller collections of medicinal crops (*Dioscorea*, *Cassia*) and industrial crops (rubber, *Sansevieria*).

## CATALOG OF PLANTS

The plants are listed alphabetically by genus and species, with allowances for the requirements of automatic data processing. The identity of all plants has not been verified, and in such cases the name under which the plant was received has been used. Many of the plants bear incomplete identifications. Some are known

only by their family affiliation, and these are entered under "unidentified." Identification numbers associated with the source of the germplasm are often included with the name proper. Assignment to families has been generally based on "A Dictionary of the Flowering Plants and Ferns" by J. C. Willis (8th ed., revised by H.

K. Airy Shaw, 1973, Cambridge University Press, London).

The column headed "PI #" lists the U.S. national plant introduction number, if any, assigned by the Germplasm Resources Laboratory, Beltsville, Md. (a facility of the Agricultural Research Service, U.S. Department of Agriculture). Detailed information regarding plants with PI numbers can be obtained from the bound volumes of the "Plant Inventory" (U.S. Department of Agriculture, Washington, D.C.) to be found in many libraries. The "M #"

(for Miami number) is the Subtropical Horticulture Research Unit's accession number; always give this number in correspondence about plants in the catalog. The "year" column gives the year plants or seeds were received; if no date is given, the year of accession is unknown. Brackets, [ ], indicate a subscript in an identification number. "Plt" indicates plant. Numbers and letters making up all or part of a cultivar name, especially in *Coffea* and *Theobroma*, identify a particular clone or selection and were assigned by the originating person or station.
